

ABSTRACT

A virtual computer system including a reallocation means,
in which a plurality of LPAR are operated by logically dividing
5 physical resources composing a physical computer exclusively
or in time dividing manner so as to dynamically change
reallocation of physical resources among each of LPARs. Based
on load conditions measured by an application or an OS of each
LPAR, physical resource allocation to each LPAR is determined,
10 thereby conducting reallocation of LPAR.
